PAID-CHANNEL ENGAGEMENT PROPOSAL

# Paid Acquisition Engine

Comprehensive architecture, build, and launch of paid acquisition across Google Ads, Meta Ads, and LinkedIn Ads. Tracking spec, full campaign builds, performance dashboard, and ongoing strategic management included.

**PREPARED FOR**
Falcon Labs

**PREPARED BY**
Kenny Hyder, Hyder Media

**DATE**
June 25, 2026

**VALID THROUGH**
August 31, 2026

SECTION 01

# Where We Landed

A single, comprehensive paid-channel engagement sized to Falcon's $25K/month initial ad budget. Foundation work covers all three target platforms; ongoing management scales with results.

### What changed from the original proposal

**Email program deferred.** Per Falcon's request, the email program is removed from this scope. Can be revisited via a separate engagement amendment if and when Falcon's lifecycle attribution needs grow.

**Conversion tracking implementation handled by Falcon engineering.** Hyder Media architects the tracking spec, defines server-side requirements, configures platform-side conversion endpoints, and validates the implementation end-to-end. Falcon engineering builds the site-side and app-side tags from that spec. This split substitutes for the email-based attribution layer in the original proposal.

**Single foundation fee covers all three ad platforms.** Google Ads, Meta Ads, and LinkedIn Ads are all in scope at signing. The fee is paid once. Launch sequencing is a strategic conversation we have together based on what discovery surfaces, not a menu of platform options to pick from.

Full scope detail, technical approach, and account ownership terms inherit from the original proposal at hyder.me/falcon-proposal except as modified here.

SECTION 02

## Unit Economics — Same Anchor

Performance targets and bonus calibration still anchor on the per-merchant economics Falcon shared:

| | |
|---|---|
| **$63K**<br>ANNUAL LTV / MERCHANT | **$0.35**<br>PER ORDER MONETIZATION |
| **30%**<br>TAKE RATE / MARGIN | **$25K**<br>INITIAL MONTHLY AD BUDGET |

The expanded performance bonus structure in Section 06 is calibrated against the $63K LTV with deliberately accessible triggers, so the bonus structure is reachable even at the initial ad budget when performance is good.

SECTION 03

# The Engagement

## Foundation

# $15,000

One-time, due on signing. Covers complete architecture, build, and launch infrastructure for all three platforms (Google Ads, Meta Ads, LinkedIn Ads), plus tracking spec, dashboard, and strategic foundation.

### Monthly recurring

- $5,000/month minimum for ongoing paid-media management, applied from the month after launch onward
- Tiered percentage of combined ad spend across all live platforms once ad spend scales past the minimum threshold:
  - 10% on the first $100K/month combined spend
  - 8% on $100K–$250K/month
  - 6% on spend above $250K/month
- Whichever is higher in any given month (minimum or calculated percentage)
- At Falcon's stated $25K/month initial ad budget, the $5K minimum applies. The percentage tier takes over once combined spend scales past $50K/month.

### Performance bonus

Quarterly bonus structure tied to blended CAC against the Scale-phase target. Three accessible tiers (10% / 15% / 20% of net profit) with the Scale target set deliberately conservatively at the end of month 3 against measured performance. Full structure in Section 06.

## Term

- **12-month minimum**, auto-renewing quarterly
- 30 days written notice for non-renewal after the initial term
- Reporting dashboard access via private, password-protected URL on hyder.me, available 24/7 to the Falcon team for the duration of the engagement

SECTION 04

# What's Included

The foundation fee covers complete architecture and build across six interlocking workstreams. The work itself is dense; most of it isn't visible from outside but determines how well every dollar of ad spend performs from day one.

### Conversion tracking architecture & platform configuration

Done first, before any campaign work, so that every ad spend dollar is measurable from the moment it launches.

- Audit current tracking state on falconlabs.com and across the customer journey
- Define complete event taxonomy spanning anonymous visitor → lead → install → active merchant → revenue-generating merchant
- Architect the data layer specification: what variables need to be available on what events, with what naming conventions
- Design server-side conversion infrastructure for Meta CAPI, LinkedIn server-side events, and Google enhanced conversions, including deduplication logic to prevent inflated counts when client-side and server-side fire together
- Document UTM convention and click-ID handling across all paid traffic
- Package the above into a clear implementation spec that Falcon engineering can build directly from, with example event payloads and validation criteria
- Configure platform-side endpoints, conversion actions, custom conversions, and value attribution settings
- Set up Apollo.io integration for inbound lead attribution and CRM enrichment
- End-to-end validation of every conversion path before any paid campaign goes live

### Google Ads campaign architecture & build

Audit of any existing infrastructure first, then a full build calibrated to the customer Falcon actually wants.

- Discovery audit of Falcon's existing Google Ads account — what's reusable, what needs rebuilding, what's holding back performance

- Account structure: campaign architecture by intent (high-intent search, branded defense, conquest, category prospecting), ad group segmentation by buyer persona and product fit
- Comprehensive keyword research using Hyder Media's PPC tooling and competitive intelligence data on the post-purchase monetization category
- Negative keyword strategy — the work that prevents wasted spend on low-intent traffic
- RSA ad copy: multiple variations per ad group with extensions, sitelinks, callouts, structured snippets aligned to Falcon's positioning
- Bid strategy selection per campaign (manual vs. smart bidding) and budget allocation aligned to the $25K/month initial budget
- Audience layering: in-market, affinity, custom intent, customer match where applicable
- Conversion action configuration mapped precisely to the tracking spec, including value-based bidding setup
- Scripts and automation rules for ongoing optimization and anomaly detection
- Initial QA across every live campaign before traffic starts

### Meta Ads campaign architecture & build

Audience seeding off Falcon's existing customer list is where Meta wins fastest. The build prioritizes that, then layers prospecting.

- Custom audience build from Falcon's existing merchant contact list with proper data hashing for Meta match rates
- Lookalike modeling at 1–3% quality tier (similarity-focused) and 5–10% scale tier (reach-focused), seeded against Falcon's highest-value paying merchant cohort
- Website custom audiences for retargeting visitors who didn't convert
- Engagement-based custom audiences (video viewers, lead form openers, page engagers)
- Exclusion audience strategy to prevent ad spend on already-acquired merchants and ineligible profiles
- Prospecting layer: interest, behavior, and demographic targeting against the mid-market DTC ICP
- Campaign architecture by objective: lead-gen, traffic-to-install, and acquisition reinforcement
- Ad copy and angle development across video, single-image, carousel, and Lead Gen Form formats. (Image and video creative assets produced by Falcon's designer; Hyder Media handles strategy, structure, and text.)
- Creative testing framework: variation matrices that systematically test angle, format, and CTA
- Conversion event mapping through the server-side CAPI implementation

- Budget pacing strategy across campaign objectives and prospecting/retargeting allocation
- Initial QA across every live campaign before traffic starts

### LinkedIn Ads campaign architecture & build

LinkedIn is the right channel for the mid-market DTC audience Falcon targets, but it has its own playbook. The build includes a discovery sprint to validate audience hypotheses before scaled spend.

- Discovery sprint to validate LinkedIn audience hypotheses and test ad copy resonance before committing scaled budget
- Matched audience upload of Falcon's CRM with hashing and match-rate optimization
- Account-list research and targeting: curated mid-market DTC brand lists matching the 50K+ monthly-orders ICP
- Job-title and seniority targeting: Founder, Head of Growth, VP eCommerce, Director of CX
- Sponsored Content templates and ad copy across multiple angles
- Lead Gen Form configuration with field strategy optimized for completion rates
- Document Ads strategy for lead-magnet-driven acquisition where applicable
- Server-side conversion event configuration aligned to the tracking spec
- Budget allocation across audience and campaign segments
- Initial QA across every live campaign before traffic starts

### Cross-platform performance dashboard

Custom-built reporting dashboard that consolidates Google Ads, Meta Ads, and LinkedIn Ads performance into a single view, hosted on Hyder Media infrastructure. Falcon Labs gets a private password-protected URL with 24/7 access.

- Architecture: data model, API integration points, hosting infrastructure on hyder.me
- Real-time data pulls from Google Ads, Meta Ads, and LinkedIn Ads APIs via Hyder Media's existing platform API connections
- Aggregated cross-channel performance views with blended ROAS, CAC, and spend pacing
- Per-platform deep-dive views with campaign, ad group, ad, and audience-level metrics
- Attribution view with conversion source breakdown and journey visualization
- Spend pacing and budget forecast tools with projection rollups
- Custom UI/UX styled to Falcon Labs' brand

- Private password-protected URL on hyder.me for Falcon Labs team access

Hosting the dashboard on Hyder Media infrastructure (rather than provisioning it to a Falcon-controlled domain) uses Hyder Media's existing API credentials and deployment pipelines. This avoids the additional engineering work of standing up new API connections under Falcon's accounts, provisioning client-side hosting, and managing a separate deployment infrastructure, and contributes to the lower foundation fee.

### Strategic planning, site optimization & foundational thinking

The thinking work that happens before and around the technical work, which determines whether the technical work delivers results.

- Initial strategic discovery with Falcon stakeholders to align on goals, success metrics, growth phase, and constraints
- Channel mix strategy informed by Falcon's TAM, unit economics, and competitive position in the post-purchase monetization category
- Audience prioritization framework across the customer journey: where each ad platform earns its place
- Creative angle development: identifying which messages and offers resonate with the mid-market DTC ICP, refined across all three platforms
- Landing page audit and conversion recommendations for paid traffic destinations
- SEO recommendations across key Falcon Labs pages with schema markup, meta data, Open Graph, and Core Web Vitals review
- AEO (Answer Engine Optimization) review for AI-driven discovery surfaces, which are an increasingly relevant traffic source for SaaS and B2B platforms
- Sitemap and robots.txt review with recommendations for paid-landing-page indexability strategy

SECTION 05

# Launch Sequencing

All three platforms are built during the foundation period. Launch timing is determined together based on what discovery surfaces, Falcon's strategic priorities, and where the earliest signals appear strongest.

### Default recommendation: Google Ads search first

Google search captures the warmest intent traffic Falcon's category produces. People searching "post-purchase upsell platform" or "Shopify revenue optimization" are already aware of the problem space and evaluating solutions. This is the fastest path to baseline CAC data, which then informs how aggressively the other channels should ramp.

### How sequencing actually works

- **Weeks 1–4 (foundation period):** tracking spec written and validated, server-side platform configurations live, dashboard built, all three ad accounts architected and built. Nothing is live yet, but everything is ready.
- **Weeks 4–6:** first platform launches based on the strategic decision made together at end of foundation (typically Google search ads).
- **Weeks 6–12:** remaining platforms layered in sequentially or in parallel based on what the first platform's data reveals about creative resonance, audience match, and CAC viability.
- **Beyond week 12:** all three platforms running at calibrated budget allocation. Cross-channel attribution and reallocation decisions made monthly based on the dashboard.

The foundation fee covers complete setup for all three platforms regardless of when each one launches. There's no "save money by skipping LinkedIn" option, because the assumption underpinning the engagement is that all three platforms eventually need to be running for the cross-channel learning compounds to work. Sequencing only affects timing, not scope.

SECTION 06

## Performance Bonus Structure

Aligned-incentive quarterly bonus tied to blended CAC against the Scale-phase target. Three accessible tiers. Falcon retains the majority of upside at every tier.

### Three deliberately accessible tiers

**Floor (always applies):** the engagement must be net positive for Falcon — annualized profit run-rate from acquired merchants exceeds total cost — before any bonus tier triggers. No bonus when Falcon isn't ahead.

**Tier 1 — 10% of net profit:** trailing 3-month blended CAC is at or below the Scale-phase target. *Matching the target triggers bonus* — not "beat target by X%".

**Tier 2 — 15% of net profit:** trailing 3-month blended CAC is 20% below the Scale-phase target.

**Tier 3 — 20% of net profit:** trailing 3-month blended CAC is 40% below the Scale-phase target.

**Net profit defined:** (merchants acquired in period × $63,000 annualized LTV) − (total ad spend + Hyder Media fees in period).

### How the Scale target gets set: deliberately conservative

At end of month 3, the Build & Test phase has produced trailing 60-day blended CAC across the platform(s) live at that point. The Scale-phase target is set at **that actual blended CAC × 1.25** — a 25% buffer above what was already achieved.

Practical impact: if actual trailing CAC during Build & Test is $4,000, the Scale target lands at $5,000. Tier 1 bonus triggers when ongoing performance matches the original $4,000 actual. Tier 2 triggers at $4,000 (20% below the $5,000 target). Tier 3 triggers at $3,000 (40% below).

The target is calibrated for upside, not gatekeeping. Either CAC stays at trailing or improves, in which case bonus tiers trigger and both sides win.

## Mechanics

- **Measurement period:** rolling trailing 3 months, assessed at end of each calendar quarter
- **First eligible period:** months 4–6, assessed at end of month 6
- **Scope:** all active paid channels combined
- **Bonus invoiced:** within 15 days of quarter close, Net 15 payment terms
- **Falcon's share at every tier:** Tier 1 = Falcon keeps 90%, Tier 2 = Falcon keeps 85%, Tier 3 = Falcon keeps 80%

SECTION 07

# Terms

Inheriting from the original proposal Section 09 except where modified here.

## What changed for this revised scope

- **Email program removed** from scope. Can be added back via a separate scope-of-work amendment at any time during the engagement.
- **Conversion tracking implementation ownership** transferred to Falcon engineering, with Hyder Media owning the architecture spec, server-side platform configuration, and end-to-end validation.
- **Foundation fee:** $15,000 one-time, down from $30,000 in the original. Reflects the removal of email infrastructure work, the transfer of tracking implementation labor to Falcon engineering, and the consolidation of the dashboard onto Hyder Media infrastructure. Foundation work itself remains comprehensive across all three ad platforms.
- **Tiered percentage of ad spend** structure adjusted to 10% / 8% / 6% (from 8% / 6% / 4% in the original). The higher starting rate scales the ongoing fee with the actual size of ad spend as the engagement grows.
- **Monthly minimum:** $5,000, down from $7,500 in the original. Balanced by the tiered-percentage adjustment above.
- **Reporting dashboard hosting** on Hyder Media infrastructure (private, password-protected URL on hyder.me) instead of provisioning to a Falcon-controlled domain. No license transfer to Falcon Labs. Reporting access maintained throughout the engagement.
- **Performance bonus structure** remains the accessible-tier structure introduced in the prior options doc.

## What didn't change

Account ownership of the Google Ads, Meta Ads, and LinkedIn Ads accounts themselves remains with Falcon Labs. Confidentiality, reporting transparency, invoicing terms (Net 15), early termination provisions, and creative scope (image and video assets remain outside Hyder Media's production scope) all carry forward from the original proposal Section 09 unchanged.

SECTION 08

## Get Started

Sign the engagement letter and remit the foundation fee. Discovery week begins immediately, with the Google Ads infrastructure audit and stakeholder alignment session in the first five business days.

### Initial investment to commence

Comprehensive foundation work across all three platforms, delivered in weeks 1–4 before any paid spend launches.

FOUNDATION FEE (ON SIGNING)

**$15,000**

$5,000/month management begins the month after first platform launches. Performance bonus structure activates from month 4.

Prepared by **Hyder Media** for **Falcon Labs**

Kenny Hyder · kenny@hyder.me · hyder.me

This document presents Falcon Labs' revised paid-channel engagement following the June 23–25 conversation (defer email, $25K/month initial ad budget, conversion tracking implementation handled by Falcon engineering, reporting dashboard hosted on Hyder Media infrastructure). Scope of work, technical approach, account ownership, and confidentiality all inherit from the original proposal at hyder.me/falcon-proposal except where explicitly modified here. The $63K annual profit per merchant figure (50K monthly orders, $0.35 per order, 30% take rate) was provided by Falcon and serves as the LTV anchor. Specific Scale-phase CAC target is set at end of month 3 against trailing 60-day actual × 1.25 (a 25% conservative buffer). Document valid through August 31, 2026. All dollar amounts USD.
